Visibility of System Status

“The design should always keep users informed about what is going on, through appropriate feedback within a reasonable amount of time.”

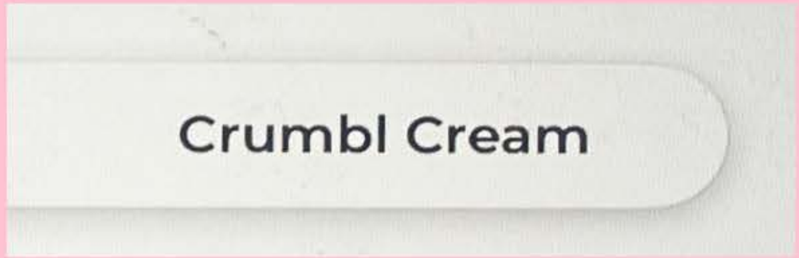

Visibility of System Status

The Crumbl kiosk does not have photo or video cycling is show an idle state, instead the user the first part of the journey where they make a choice about what they want to buy.

Match Between the System and the Real World

For the most part the language was understandable, the only odd thing was “Crumbl Cream,” which after some digging I learned was their brand of ice cream.

Match Between the System and the Real World

The design should speak the users' language. Use words, phrases, and concepts familiar to the user, rather than internal jargon. Follow real-world conventions, making information appear in a natural and logical order.

User Control and Freedom

Users often perform actions by mistake. They need a clearly marked "emergency exit" to leave the unwanted action without having to go through an extended process.

User Control and Freedom

As I went though the program, this button became my best friend. The biggest struggle was that I wasn't able to access the menu at any given step.

Consistency and Standards

Users should not have to wonder whether different words, situations, or actions mean the same thing. Follow platform and industry conventions.

Consistency and Standards

Besides the Crumbl brand products, there weren't any major red flags.

Users should be able to navigate the kiosk without thinking too much.

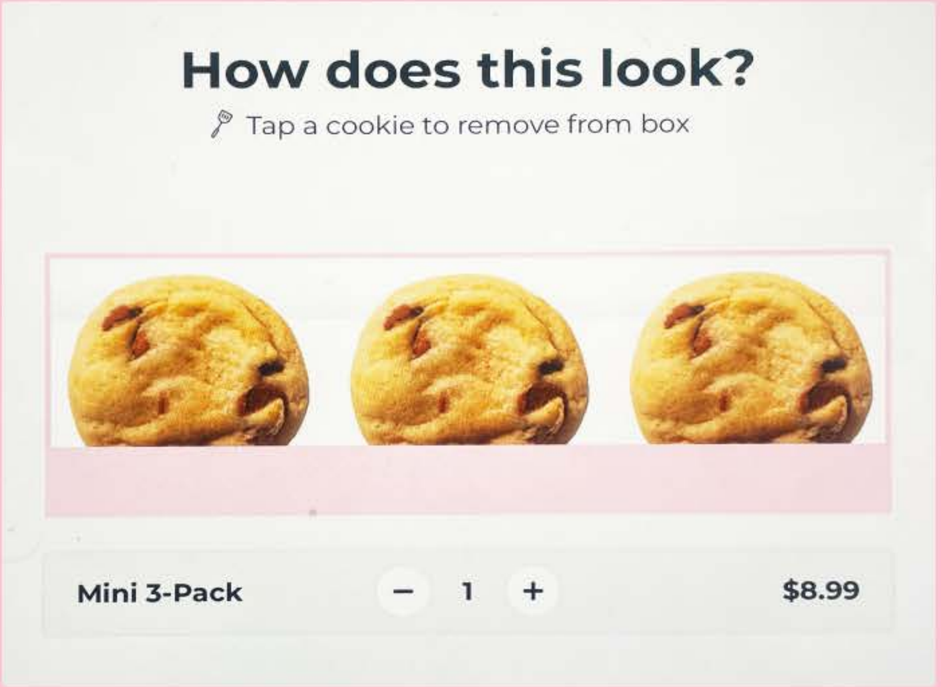

Error Prevention

Good error messages are important, but the best designs carefully prevent problems from occurring in the first place. Either eliminate error-prone conditions, or check for them and present users with a confirmation option before they commit to the action.

Error Prevention

My favorite way Crumbl prevented a purchasing error was showing this little box where you could see exactly what was in your box.

Visual presentation made it easier to understand what I was buying.

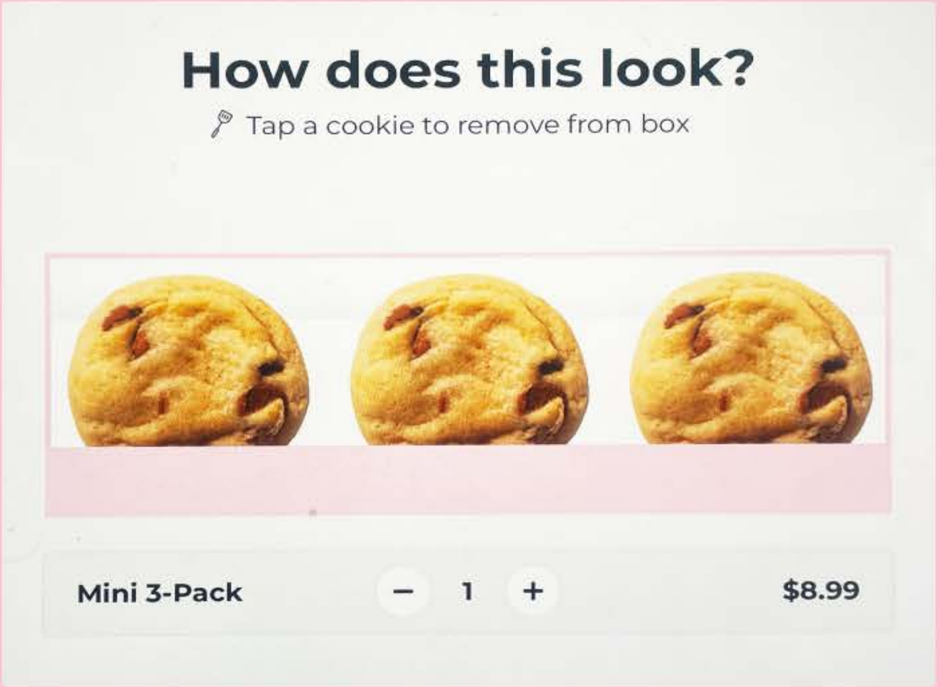

Recognition Rather than Recall

Minimize the user's memory load by making elements, actions, and options visible. The user should not have to remember information from one part of the interface to another. Information required to use the design (e.g. field labels or menu items) should be visible or easily retrievable when needed.

Recognition Rather than Recall

Great Recognition as well as Error Prevention.

I could see this being helpful if the user was looking to buy a dozen different cookies for different people, especially if they couldn't remember the cookie names.

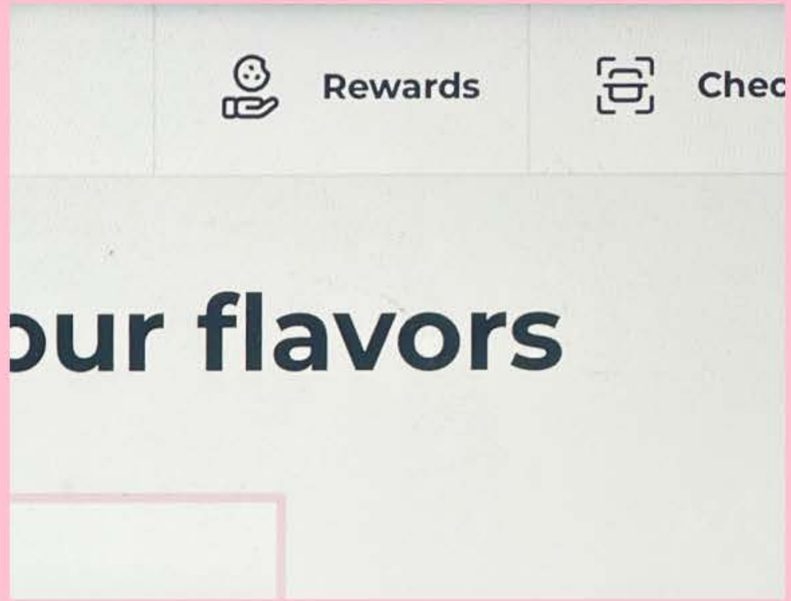

Flexibility and Efficiency of Use

Shortcuts — hidden from novice users — may speed up the interaction for the expert user so that the design can cater to both inexperienced and experienced users. Allow users to tailor frequent actions.

Flexibility and Efficiency of Use

The best example of this is likely the “Rewards,” category at the top of the page, allowing users to cash in on points that they’ve collected.

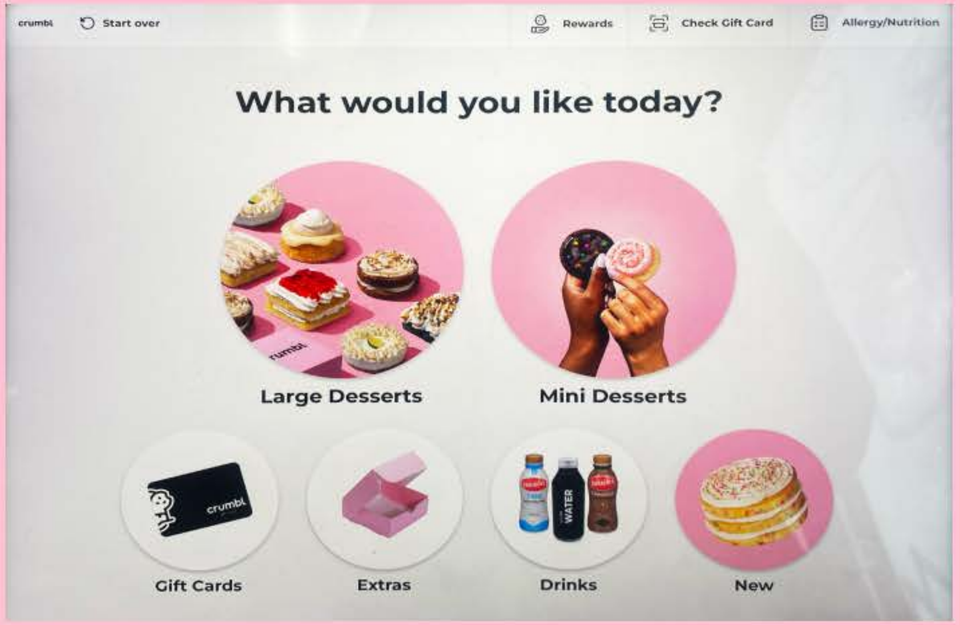

Aesthetic and Minimalist Design

Interfaces should not contain information that is irrelevant or rarely needed. Every extra unit of information in an interface competes with the relevant units of information and diminishes their relative visibility.

Aesthetic and Minimalist Design

Crumbl does this fairly well with the categories being sorted into sections, but the continuity is broken with the bubbles being different colors, there was nothing breathtaking about this design.

Help Users Recognize, Diagnose, and Recover from Errors

Error messages should be expressed in plain language (no error codes), precisely indicate the problem, and constructively suggest a solution.

Help Users Recognize, Diagnose, and Recover from Errors

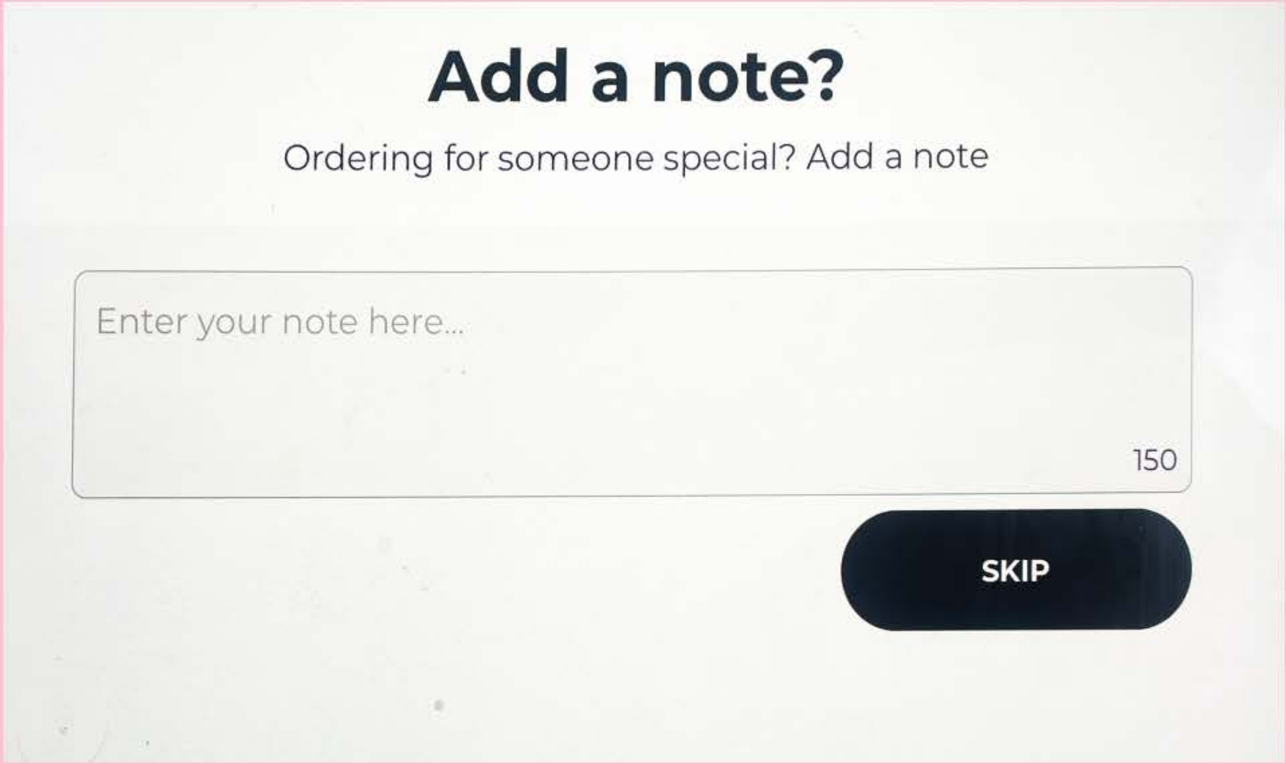

Despite trying to break the kiosk, I couldn't figure out how. The kiosk gives the user very few decisions to make (past cookie selection that is) for better or for worse.

Help and Documentation

It's best if the system doesn't need any additional explanation. However, it may be necessary to provide documentation to help users understand how to complete their tasks.

Help and Documentation

Small instructions were scattered throughout the journey and were much needed...
I specifically enjoy when they told me twice to add a note.

Conclusion

1

The kiosk was simple enough to use, although it wasn't as aesthetically pleasing as it could have been.

2

The fear of looking too 'cute,' was holding the designers back. Crumbl has such a fun and youthful typeface and color, but that hardly showed up in the kiosk design.

3

The size of the kiosk also made me feel like the Apple Store Monkey, just something to consider when choosing a screen size.

Thank You
