Wireframes

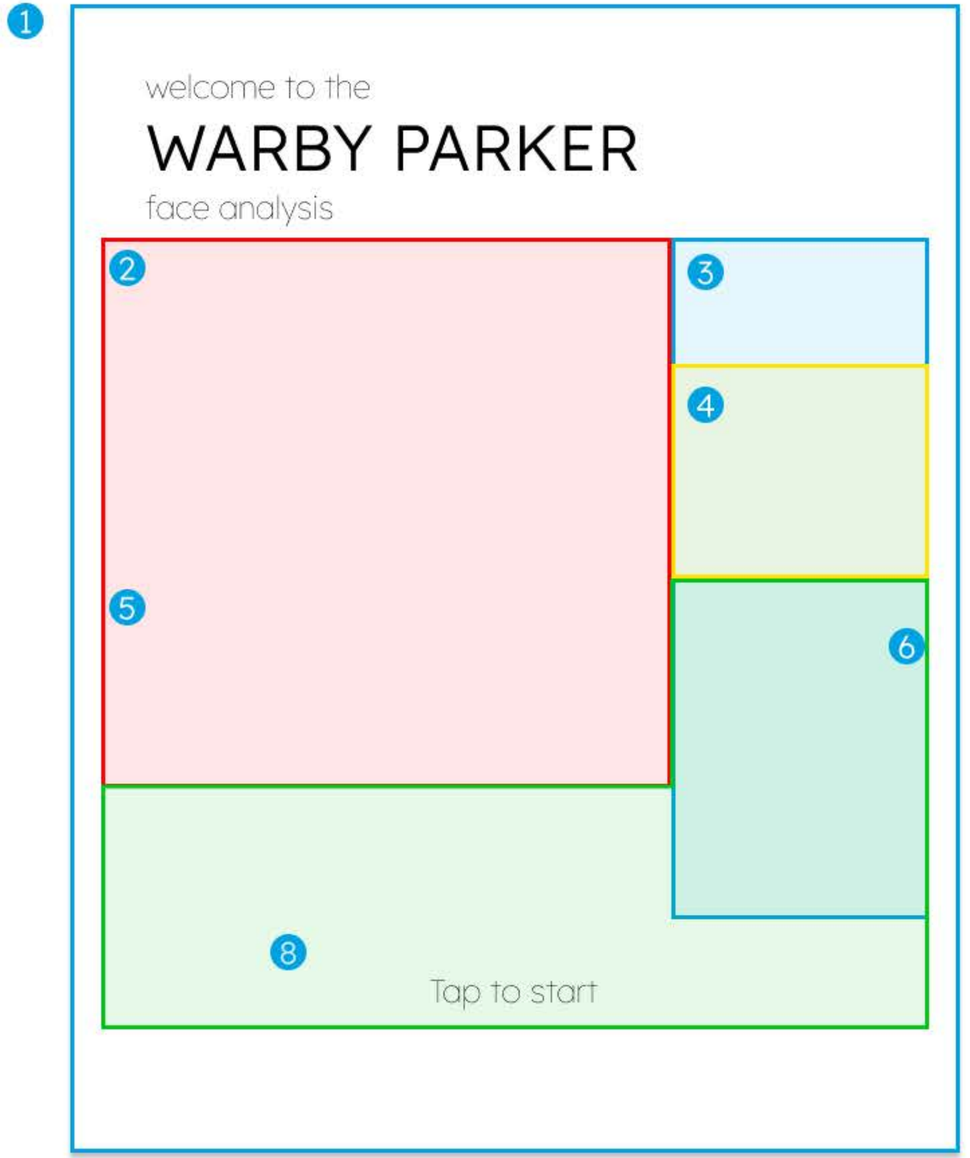

Creating a working rough prototype before finalizing the designs.

The Warby Parky kiosk is an in-store digital styling assistant using a smart mirror. Because of this, there are limited touch zones to preserve cleanliness, and a minimal design style to preserve the classic qualities of a mirror.

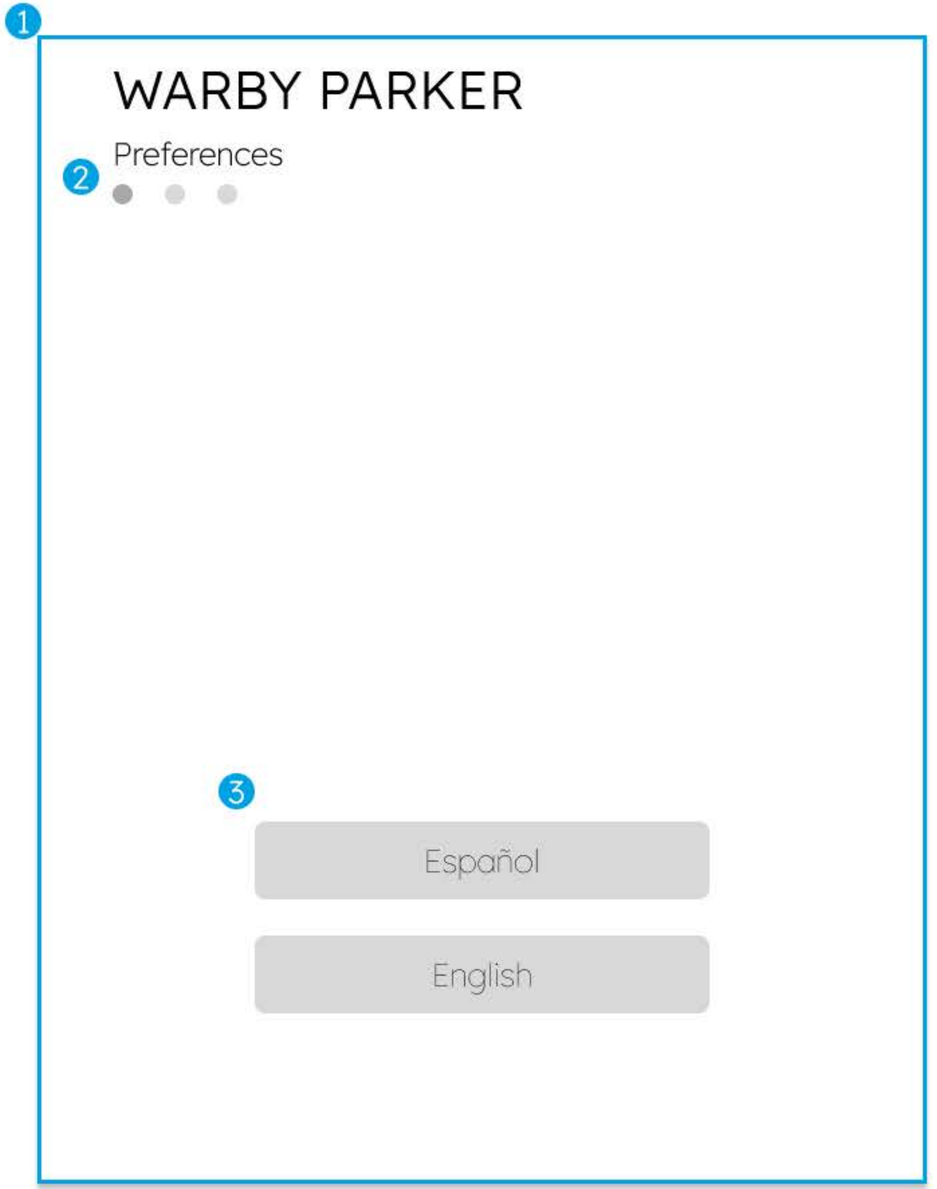

Start

1. This is my touch guide showing accessibility and ease of reach.
2. The red area represents my “no touch zone,” crucial for the function of a smart mirror to stay clean and usable.
3. The blue area is the interactive area, it is less than half the screen for optimized viewing and reach.
4. The yellow area has limited touch capabilities.
5. A large majority of the interactive content will be in the green area as it is within reach for most people.
6. This vertical slider controls the touch box height for seated users.
7. This toggle switches the right/left handed orientation, the blue and red boxes switch as well as the toggle and start button, on following screens it will keep this pattern but it will be minimized in the design and no longer include text.
8. This begins our flow

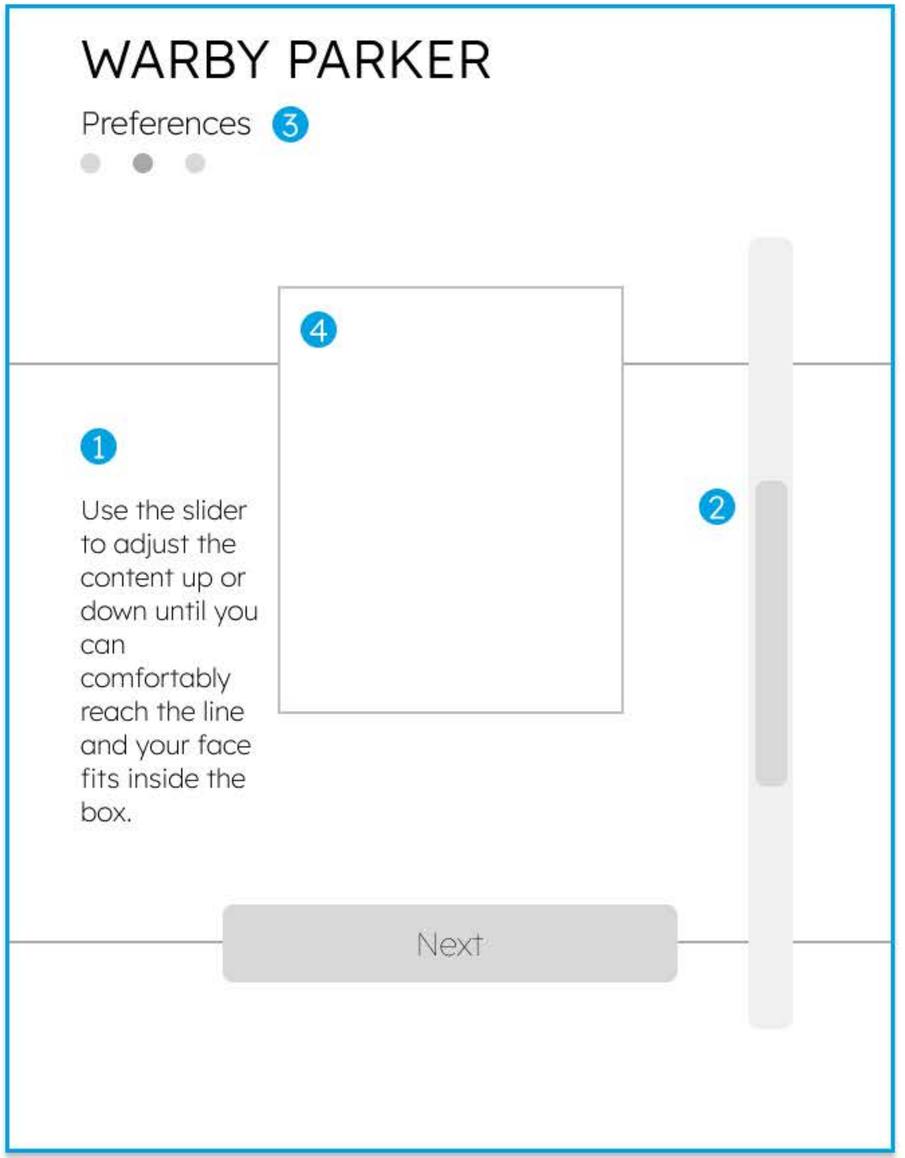

Language

1. The user is first given the option to select the language, making this the first step in the experience opens Warby Parker up to a whole new demographic.
2. This is the first page in the onboarding process.
3. As of right now, there are only two language options available.

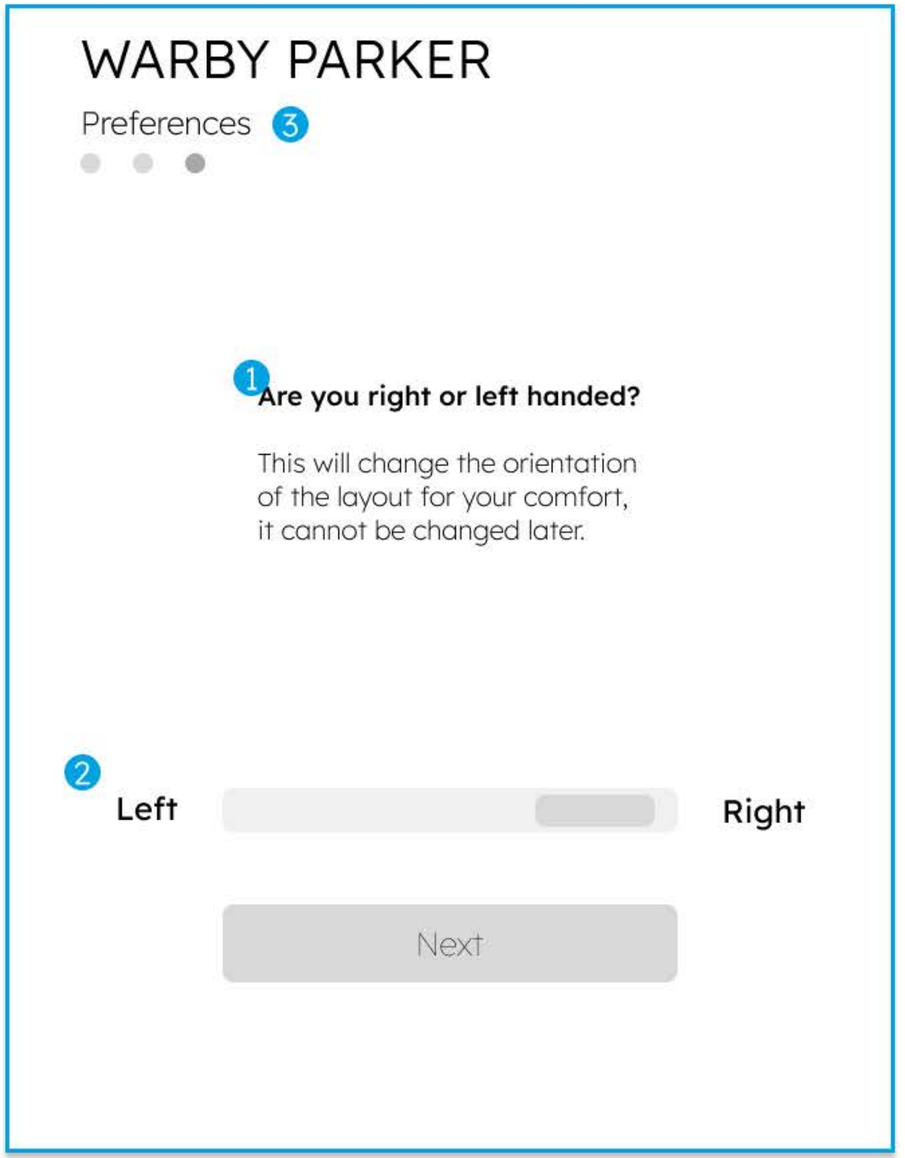

Adjust to Height

1. The user is given clear instructions on how to position the screen to fit their own unique needs.
2. The vertical slider assists any user who may not be able to reach the highest content level.
3. There is pagination at the top of the screen to let the user know how many questions have been answered so far as well as how many more are left to go.
4. The purpose of the box is so the machine can accurately detect a face, later for the facial analysis, the user will have to position an oval directly on their face.

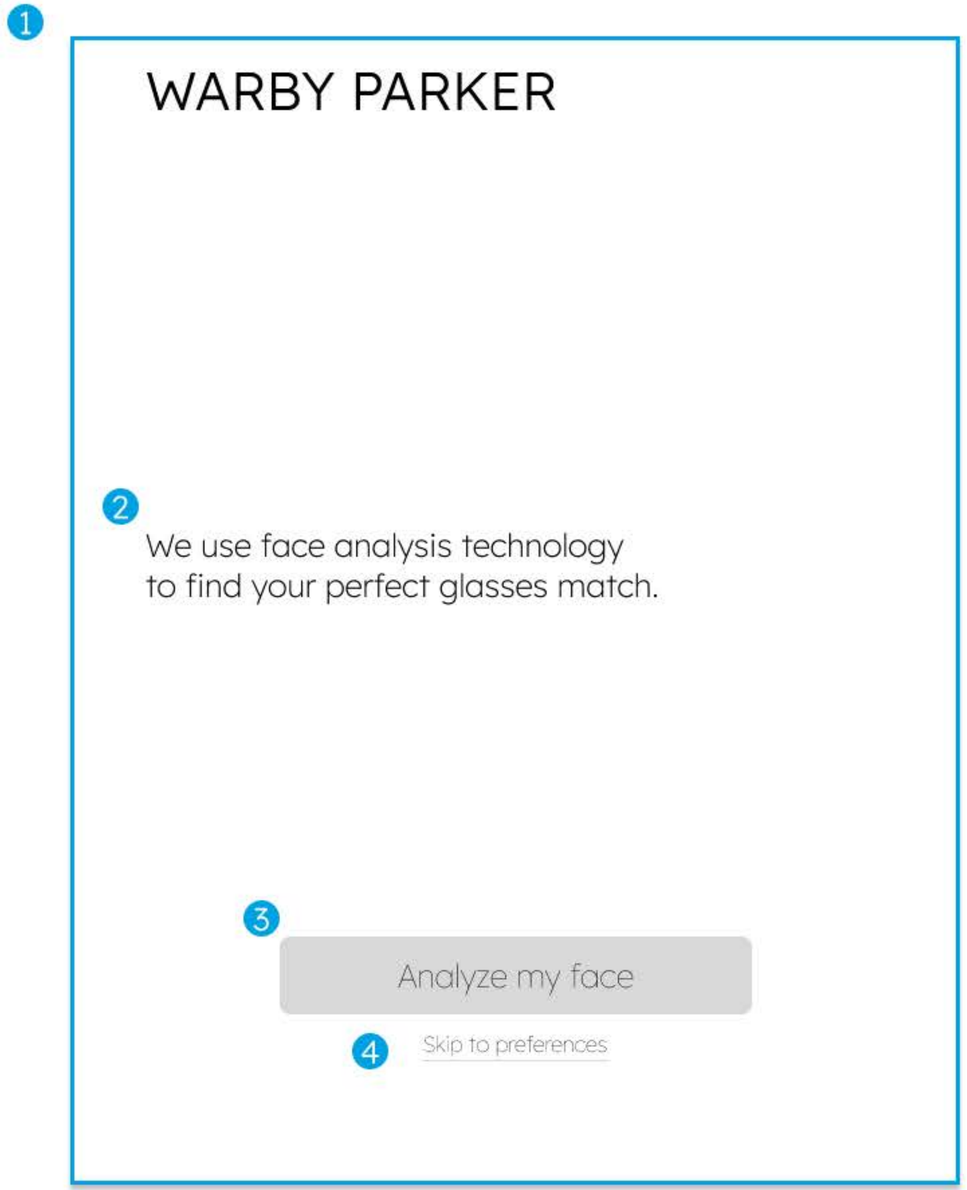

Adjust Orientation

1. The user is asked what their dominant hand is, this changes the screen orientation ensuring a comfortable experience, as well as keep the screen free of finger prints.
2. The slider sticks to either side of the screen so the user cannot place the content in the middle.
3. There is pagination at the top of the screen to let the user know how many questions have been answered so far as well as how many more are left to go.

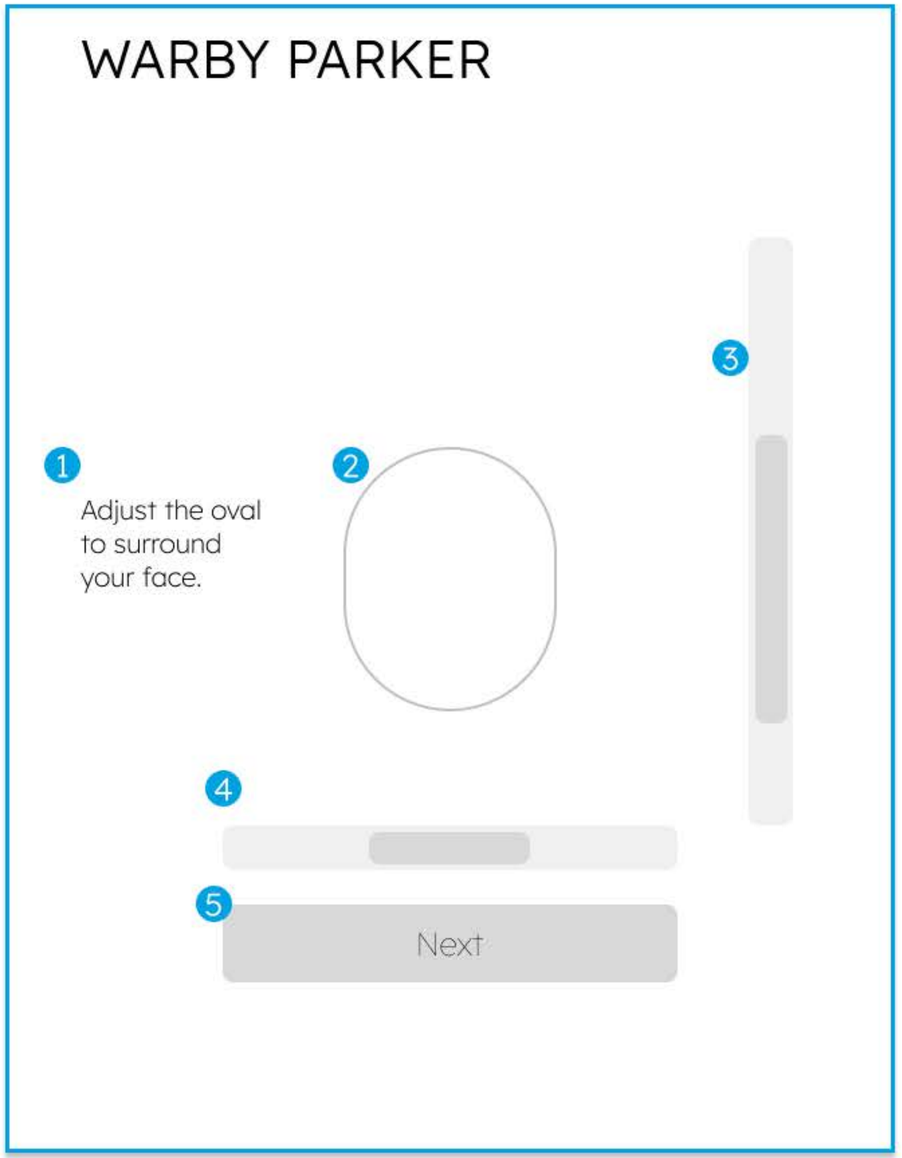

Scan or Skip

1. This screen gives the user the choice to have their face scanned or not as some people may not feel comfortable having their face cataloged by a public device.
2. The user is given the ‘what’ and the ‘why’ at this stage.
3. The option to analyze the face is given first and is higher in the content hierarchy in the hopes that most people will choose that option to engineer the best results.
4. The yellow area has limited touch capabilities.

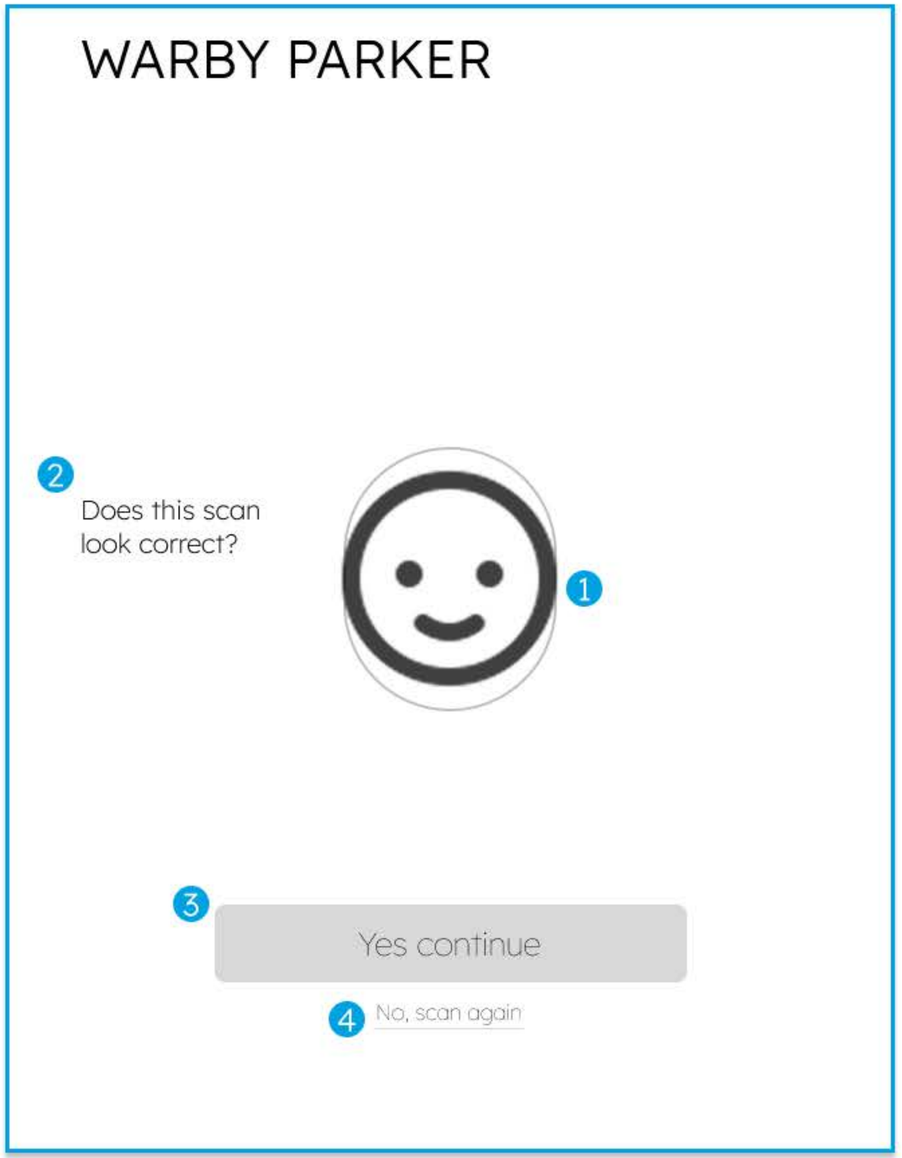

Adjust to Face

1. The user is instructed to set up an area in which their face can be most accurately detected by the kiosk.
2. The oval will likely not perfectly fit every user's face but this will aid the kiosk in setting up an accurate facial anaylsis, as well is accuracy in the glasses projection.
3. This slider controls the vertical alignment of the oval, and the bar is aligned horizontally with the oval for accurate tracking.
4. This slider controls the horizontal alignment of the oval, and the bar is aligned vertically with the oval for accurate tracking.
5. The only option at this step is to continue.

Scan Confirmation

1. This smiley face would not be incorporated in the design, it is merely representational of the user's face in the mirror.
2. This is the confirmation screen that ensures the user executed the scan correctly.
3. The default pathway is once again highlighted, designed to keep the user moving on the correct path.
4. The yellow area has limited touch capabilities.

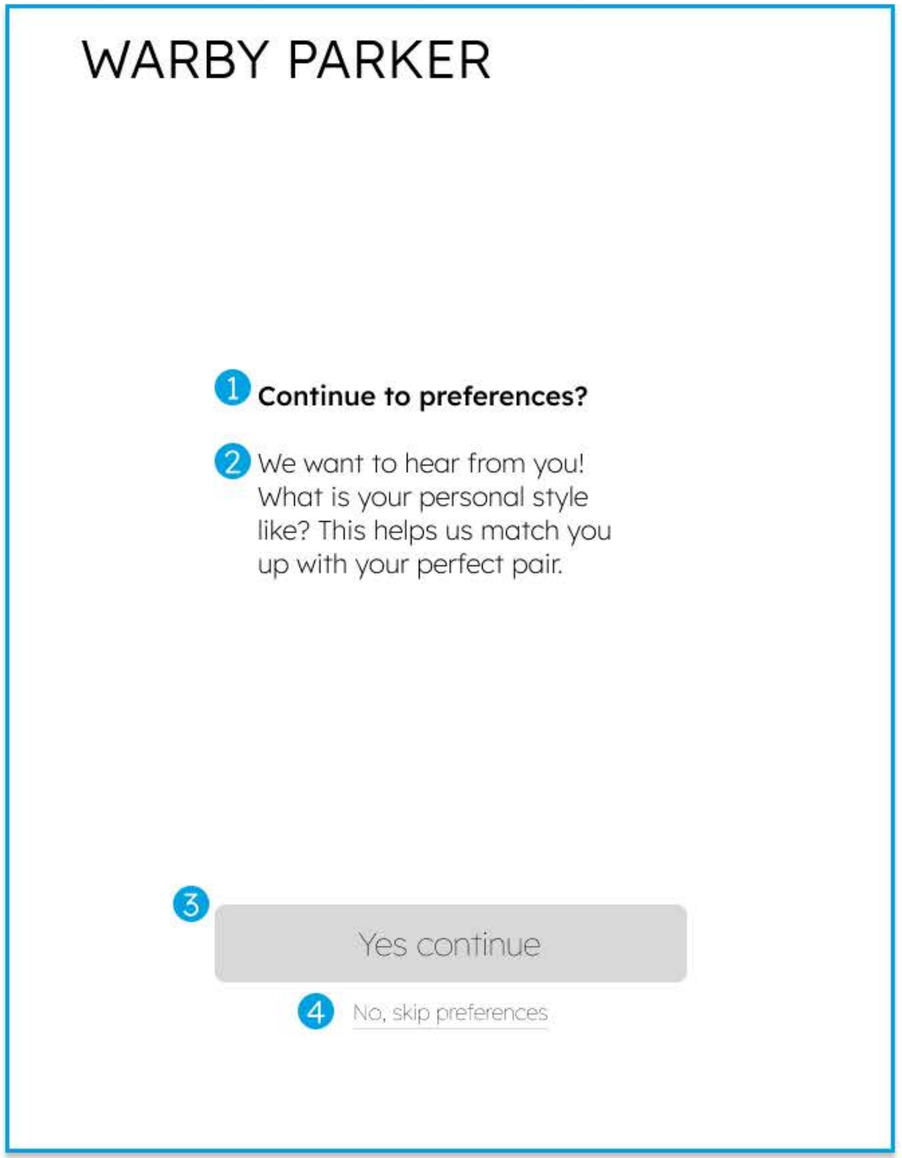

Preferences?

1. The question is the most important part,

2. The explanation is needed so that the user understands why the preferences are important, hopefully prompting them to not skip them.

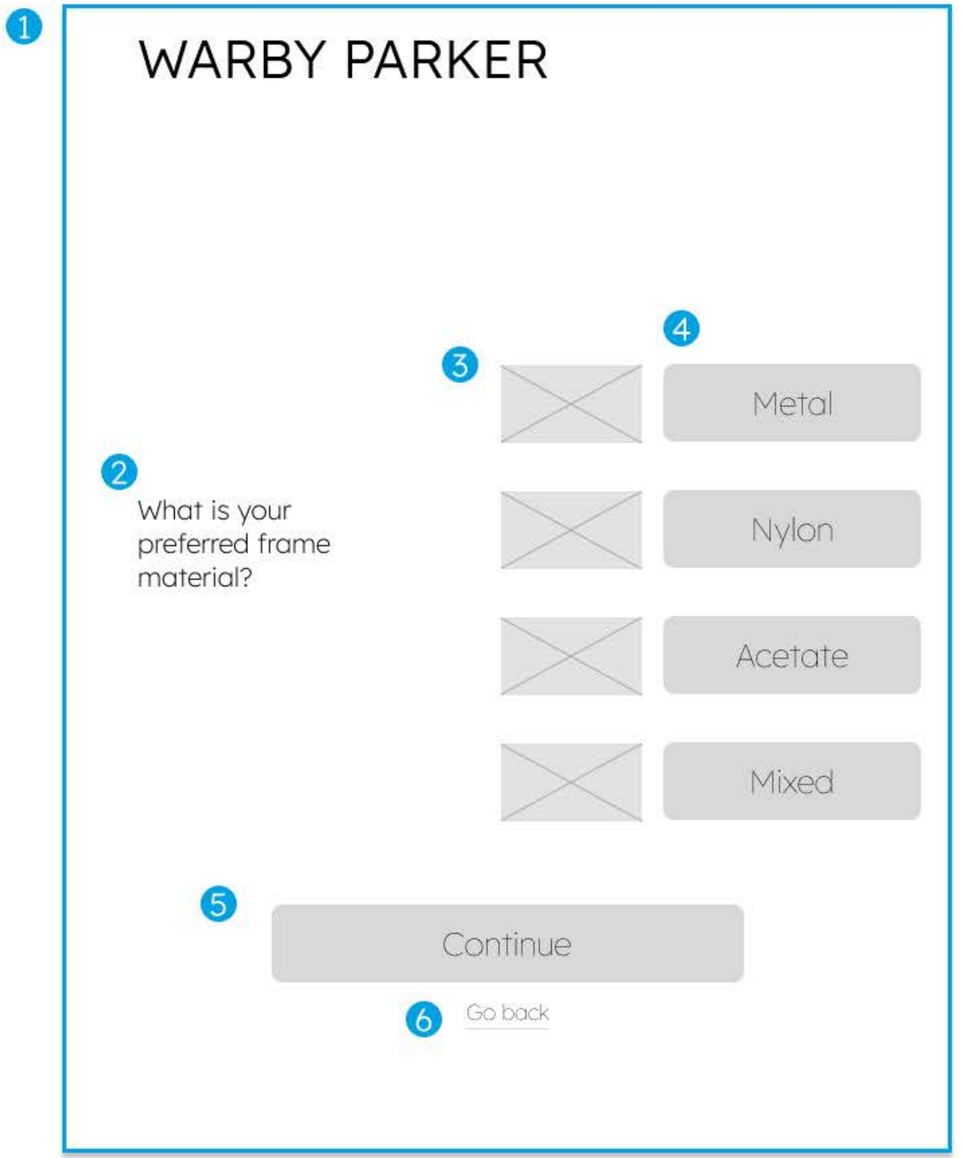

3. The default pathway is once again highlighted, designed to keep the user moving on the correct path.

4. Users do have the choice to skip and the kiosk will select glasses on them from only their facial features.

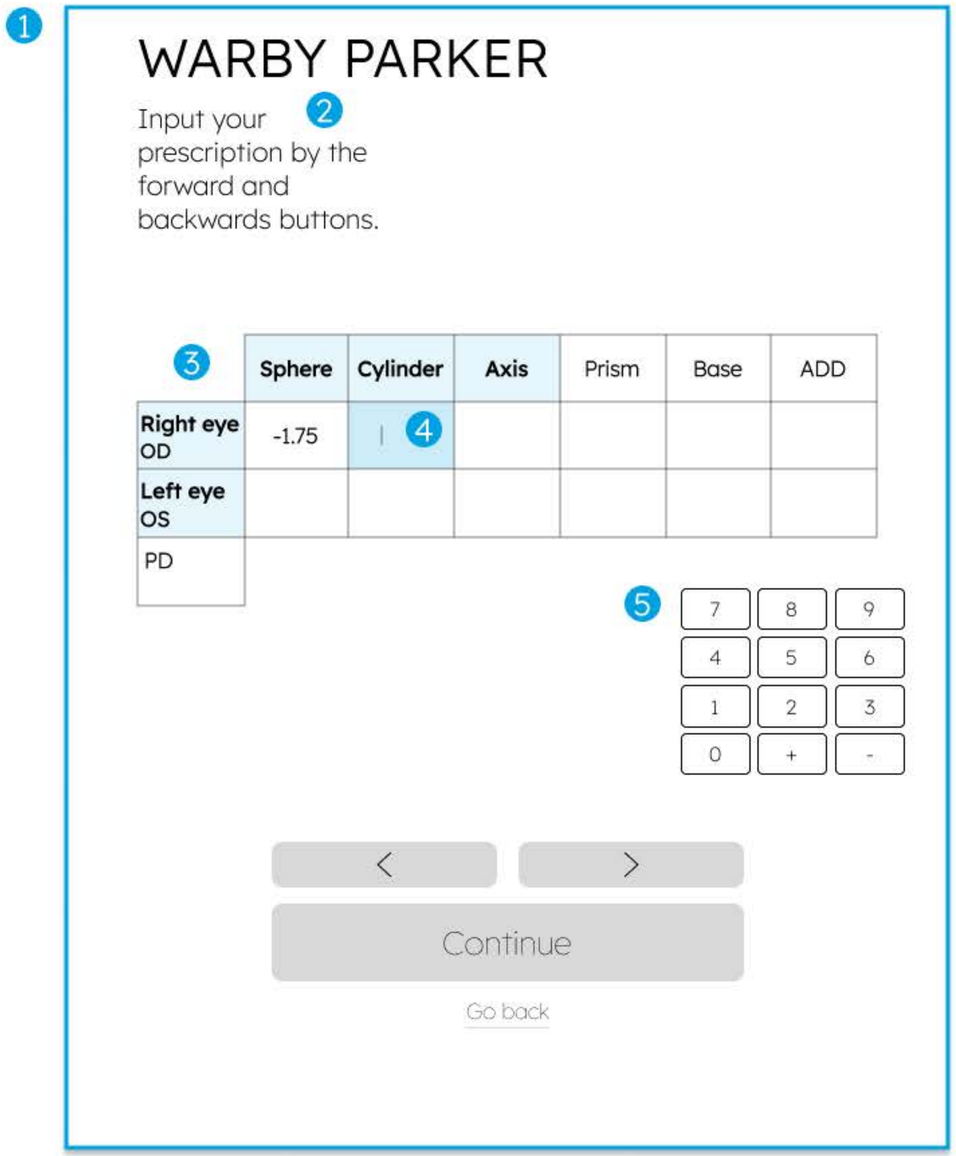

Option Screens

1. This is going to be the default screen layout for all screens with more than one option.
2. The question is asked outside of the touch zone as a creative way to fill the space as well as keeping the screen clean.
3. Choices are sometimes paired with images on the mirror to indicate different choices.
4. Choices are placed within the touch zone and aligned vertically, interactions are never placed in the middle of the screen.
5. The button to continue is always more apparent than the button to revert to previous steps.
6. The option to go back to previous screens is always given while going through the options, this is helpful in case a user changes their mind about a previous preference.

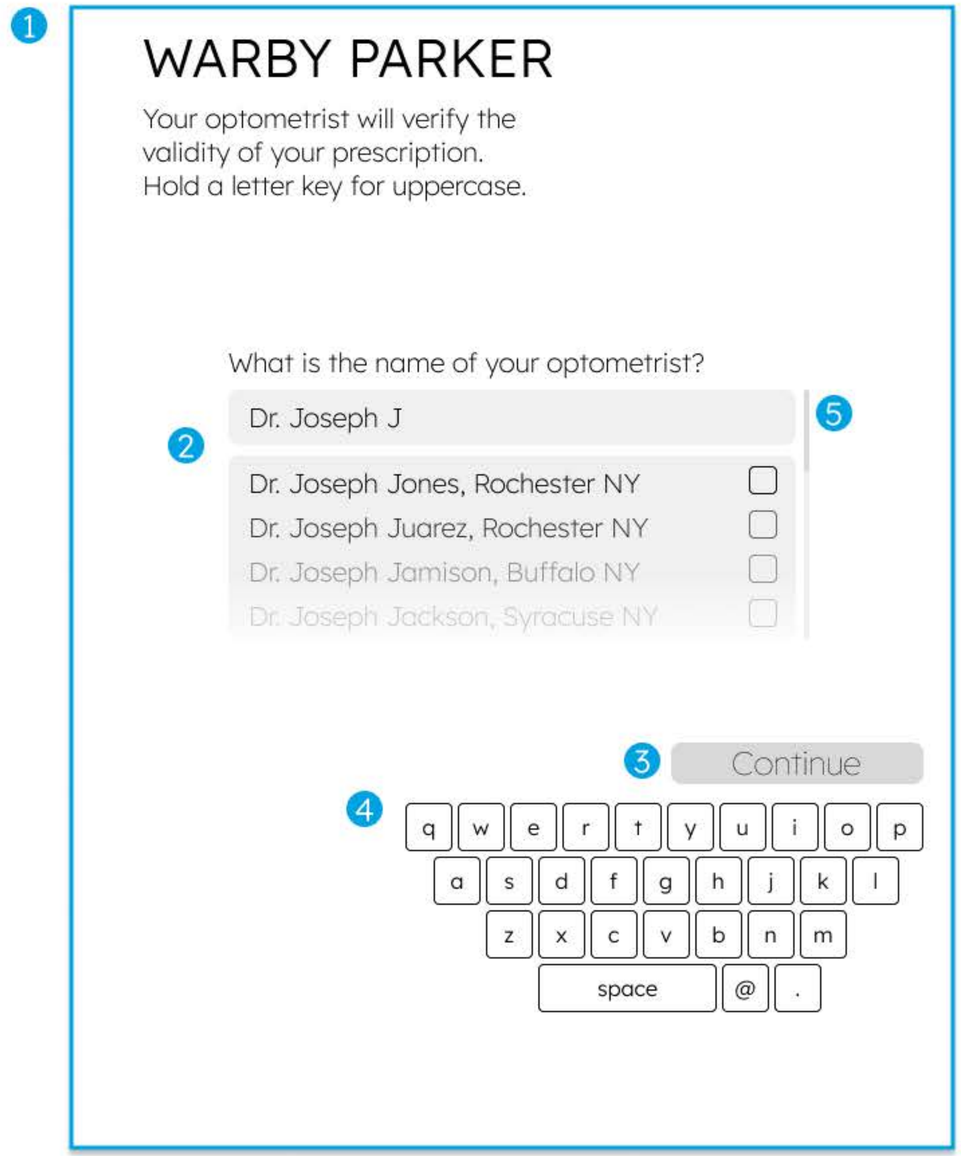

Input your Prescription

1. This screen is for when someone is actively inputting their prescription and is only accessed upon request.
2. Users are instructed to utilize the forward and backward buttons to navigate through the prescription, instead of tapping directly on the capsules.
3. The highlighted blue parts are required.
4. The selected box is a different shade to allow the user to know which input form they are filled out.
5. The keyboard is designed to only allow access to numerical values, but when it is time to fill out the base section, the choices will change to
   - BU: Base up
   - BD: Base down
   - BI: Base in
   - BO: Base out
6. The back and forth buttons were chosen to only include icons so the language choice wouldn't confuse the user, and cause them to accidentally go to the next or previous screen.

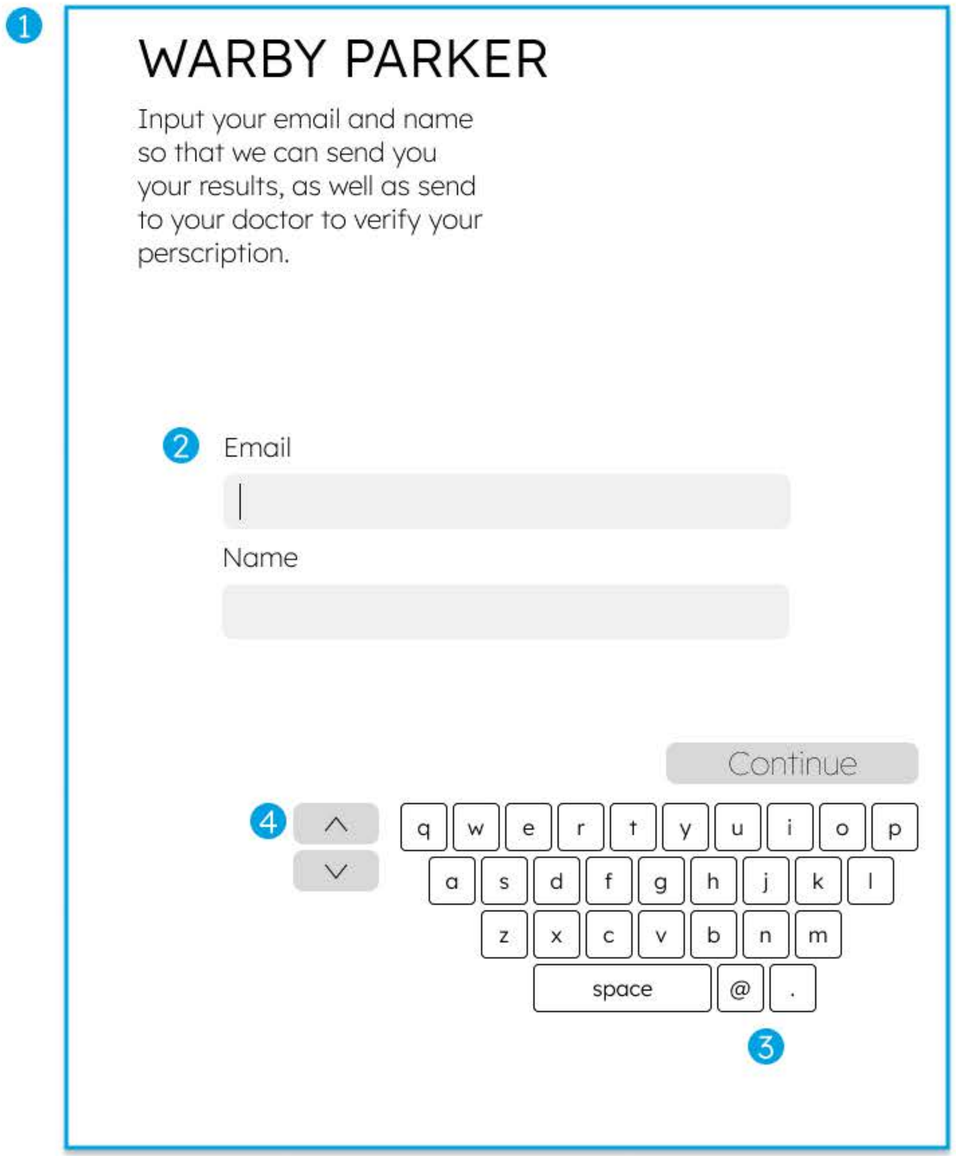

Doctor finder

1. This screen will send a message to the optometrist selected and the optometrist office will be able to verify the accuracy of the prescription.
2. Local optometrists will appear in the search recommendations and a checkbox to select the correct one will appear.
3. The continue button will save the choice of optometrist
4. This keyboard is custom to only reveal the letter characters, making it less likely for user error.
5. The slider provides an area in the touch zone so that the entire screen doesn't get dirty.

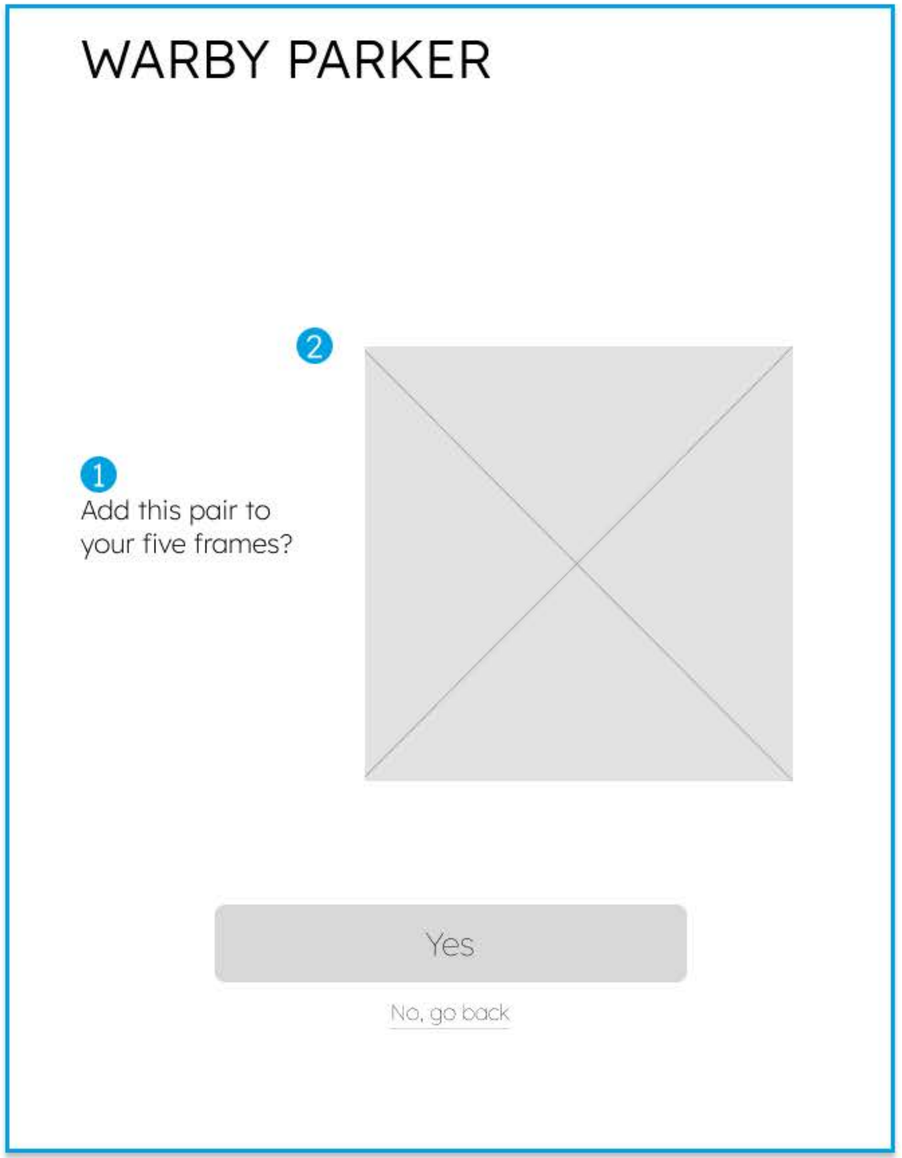

Input your Email

1. This is toward the end of the flow when users are going to be receiving their results.
2. The name and email boxes is not a clickable element, it is only controlled by the keyboard.
3. The keyboard is specifically designed for an email input, which cuts away the unneeded characters, and cuts error for margin down considerably, as well as makes the entire input quicker.
4. The up and down arrows navigate between the name and email input form.

Add this pair?

1. Confirmation that the user wants to add any certain pair to their Home Try-On list of frames.
2. This would be a high-fi image of the frames that were selected.
3. Refer back to the “Option Screens” page to see what would come before this step in the process.

Option Screens

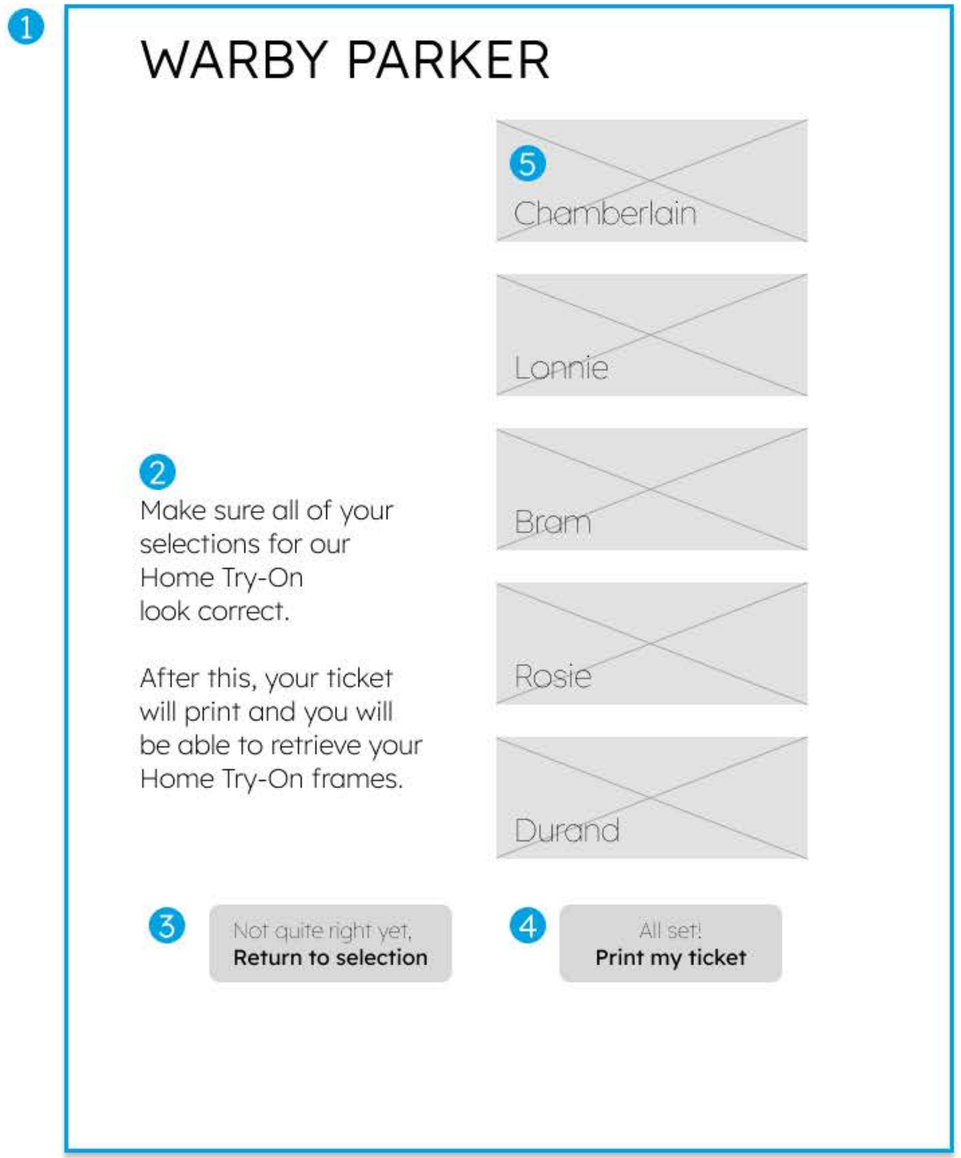

1. This screen is the last confirmation before the user prints their ticket to receive their frames, the “Yes, print ticket,” choice is a permanent action, so it is critical that the user confirms what they want.

2. Users are made aware this is an important action, as well as being made aware of the next step in the process.

3. The return button is given more context so that users do not misunderstand why you would need to return to a previous page.

4. The button to proceed is marked clearly as, “Print my ticket,” so that users know they should have a physical takeaway from the device. This also parallels the act of getting a receipt, letting the user know that this is the final action they have to take before they can move on.

5. The selections are images of the glasses and the name of the design. The image will show shape and color selected, but prescription, function, and other non-visible information is not listen in this confirmation screen.

Option Screens

1. This is the final screen. It is important that users are not confused about that and stand around waiting for something else to happen.

2. Since this is the last screen, users are not only informed as to what the kiosk is doing, but they are also given further instruction on how to retrieve the glasses they've selected.
